

THE AGENT PARTICIPATES IN EVOLUTION WITHOUT BECOMING ITS AUTHORITY

DIRECT REPOSITORY MUTATION

GOVERNED TRANSFORMATION

WHAT THE AGENT DOES IN BOTH — AND WHAT DIFFERS

Same: the agent performs the engineering work in both columns.

Differs: on the left its output *is* the new state; on the right its output is a candidate that must be authorized before any state changes.

*Evolution is not an exception to governance — it is another governed construction, run against the state the previous cycle established.*

Autonomy is unchanged. What differs is where authority sits.
