

WHETHER A DEMONSTRATION COULD HAVE FAILED

NON-DISCRIMINATING

DISCRIMINATING

WHAT SEPARATED THE TWO GROUPS

When the risk was stated explicitly — *could routing be hard-coded without detection?* — the discriminating demonstration was constructed.

When that risk was left implicit, existing evidence did not expose it.

No suite test, inspection, or evidence document made the earlier gaps visible.

A passing suite is not evidence that a demonstration could fail.

Risk-directed, not systematic; no mutation score is reported. This measures the adequacy of specific demonstrations, not coverage of the suite.
