

# THE WHOLE LIFECYCLE, NOT THE DEVELOPMENT STAGE

where authorization enters, who acts, and which stage the agent may perform

| LIFECYCLE STAGE | WHAT PGC MAKES OF IT                                        | ACTS      |
|-----------------|-------------------------------------------------------------|-----------|
| inception       | genesis — scope and profile fix what is governed            | ● human   |
| design          | P0–P8 — concerns separated, each phase admissible           | ○ agent   |
| construction    | renders an admitted design — produces a candidate           | ○ agent   |
| deployment      | promotion, then seal — two acts, neither in construction    | ● human   |
| execution       | traversal of the seal — determines nothing                  | neither   |
| evolution       | another governed transformation — not an exception          | ○● both   |
| version mgmt    | baseline #n → #n+1 — the version <i>is</i> the sealed state | automatic |

Every stage is governed. The agent may perform two entirely and participate in a third.

## WHAT IS RECAST AS A PROPERTY OF GOVERNED STATE

Conventionally each is a managed process with its own procedure, owner and audit. Here each is recast.

|                    |                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------|
| change control     | → a declared act, separate from construction; behaviour reaches the running system by sealing alone             |
| configuration mgmt | → carried inside the seal, so it is not a separate object that can drift from what executes                     |
| release approval   | → the authorization and the released artifact are one object; the authorization travels with what it authorized |
| rollback           | → a governed transformation to a retained baseline, where retention is provided — no exceptional path           |
| audit trail        | → emitted by each band as it determines, not assembled afterwards from records not built for it                 |

The concerns do not disappear. Each is discharged by the structure of the governed state rather than by a process that watches for it. What has been exercised on this surface is reported in §6–§8.

## WHY THIS MATTERS FOR AN AGENT

An agent may be given the design, construction and transformation stages in full. On the architecture's terms, delegating them transfers no authority, because authorization is located in none of them. §8 reports which boundaries were exercised and which were not.
