

WHAT THE TRANSFORMATION ADDED — AND WHAT IT LEFT ALONE

BASELINE #n

G4 →

BASELINE #n+1

two carried · three realized · five total

WHY THIS DIFF IS CHECKABLE BY SOMEONE ELSE

- both snapshot identities are derived from content, not asserted
- the two carried artifacts keep their identities — the transformation did not touch them
- the design declared the baseline by its two artifact identities before realizing anything
- a fixture supplying snapshot:wrong is refused with baseline_identity_mismatch

The agent produced the delta. It did not produce the identity that makes the delta checkable.

Identifiers are snapshot identities, not projection hashes. The wrong-baseline demonstration became discriminating only after a negative demonstration was added; at first delivery it passed with the guard removed (§8.4).
